Project Planner: one file in, a full plan out, kept up to date from site

Plan, 3 November 2026. Not built yet.

How it works

1. You start it with one file

In a chat, you (master) attach **one file**, for example the full drawing set of the JVC school (PDF, up to 100 pages / 25 MB, or a DWG up to 35 MB), and say:

> *"Make the full plan for this project."*

2. Reem reads everything in the file

From the JVC drawings, for example, it takes:

- project name, plot, owner, consultant, approval and its date,
- floors and levels (Basement –4.10 … Roof +20.20),
- staircases, lifts, rooms and their use,
- window and door schedules (types, sizes, fire ratings),
- parking, bus bays, playground.

3. It asks only what the file doesn't say, all at once

For example: start date? budget? contractor? Do you have the structural / MEP drawings or the BOQ? You answer in one message, or attach those files too.

4. It writes the full plan and shows it on one card

Phase	What Reem writes	Quality checks before the next phase
1. Brief	Scope from the file, floors, areas, deadline, budget, who is who	Every floor and area named; dates and budget confirmed by you
2. Programme	Steps and weeks per floor (concrete, blockwork, MEP, finishes)	No step without a week; hold points on every pour and cover-up
3. Quality plan	Inspection points per stage (rebar before pour, cube tests, waterproofing, MEP pressure tests, fire doors as scheduled)	Each stage has a hold point and who signs it
4. Materials	What is needed per floor and when to order it (from the schedules in the file)	Main materials ordered at least 2 weeks before they are needed
5. Manpower	Trades and headcount per week	No week with work but no trade
6. Risks	Top risks and what to do	Each risk has an owner and an action

You tap **Start** (or say what to change). The steps go into the **JVC Project** you already have, and the full plan goes to your Shelf as a PDF.

5. Francisca and Arzhel keep it updated, from chat, as now

- "20 tons of rebar arrived", "ground floor slab poured today", "MEP stopped, no pipes".
- They confirm on the usual cards. They only report; they don't change the plan.

6. Reem watches the updates against the plan

"Late" means one of these:

1. A step hasn't started by its planned week.
2. A step isn't finished by its planned week.
3. A material isn't received in time.
4. Work went ahead without the hold-point check being signed.
5. Someone reported the work as blocked.

When that happens, Reem says what is late, by how much, what it affects, and proposes a fix ("blockwork moves to week 14 — accept?"). It buzzes **you, Francisca and Arzhel**. **Only you can accept a change to the plan.**

7. A short report every week

What's done, what's late, and what's next. It goes to you in chat and by push.

What it never does alone

It never emails, pays, or writes into saifsys, and it never changes the plan without your tap.

Money

- It uses **Sonnet 5.5 only** (no Haiku).
- Reading the file and writing the plan costs about **$3–5, once**.
- After that, Reem only thinks when someone sends an update, plus once a week for the report: a little each week.
- **Test limit: $5** for making the first plan. It stops and asks you before spending more.
- It works **7:00–22:00 Dubai time** only.
- All cost shows in Billing under "Project planner".

Who

- Starts a plan: **only the master**.
- Updates: the people already in the project (**Francisca, Arzhel**).
- Late alerts: **master + Francisca + Arzhel**.

Build in steps

Step	What you get
1	One file in chat → Reem reads it and asks its questions → plan card → Start puts the steps into the Project, PDF on Shelf
2	Late checks against the plan + push to you, Francisca and Arzhel + "accept this change?" card
3	Weekly report
4	Rules: what you correct, it remembers for the next project

First test: the JVC school, with your drawing file.

Outside services

None.
